

Nigeria Service Export Gateway — Product Requirements Document

Programme: Nigeria Service Export Gateway (NATEP / NCMSE) **Executive Sponsor:** Federal Ministry of Industry, Trade and Investment (FMITI) **Business Owner:** NATEP / NCMSE Secretariat **Technical Authority:** Architecture, Data, Security & Privacy Authority (ADSPA) **Version:** v1.0 — Full scope, Modules 1 to 8 **Baseline:** Integrated Four-Part TOR v1.1; NATEP BRD/FRD Modules Specs (Modules 1–8) **Status:** Draft for consultant and Secretariat confirmation. Section 10 must be closed at Gate G1.

0. Purpose and reading conventions

This PRD covers the complete scope of the BRD — the Shared Foundation and all six portals. It is the single product definition the delivery team builds from, and it supersedes the two competing readings present in the source pack.

0.1 Portal naming

The source uses the same portal numbers for different domains: "Portal 2" is Regulatory Trust in Module 1 and Supply in Module 4; "Portal 3" is Supply in Module 1 and the Observatory in Module 5. Portals are therefore referred to by name throughout this document. The mapping is fixed as follows and is used in every downstream artefact.

Domain name (used here)	Source module	Portal number in Modules 3–8
Foundation	Module 2	— (shared layer)
Demand	Module 3	Portal 1
Supply	Module 4	Portal 2
Observatory	Module 5	Portal 3
Promotion	Module 6	Portal 4
Financing	Module 7	Portal 5
Disputes	Module 8	Portal 6

Regulatory Trust is a capability, not a portal, in this scope. Module 1 and the TOR require a requirements register, a personalised requirements wizard, a change-alert engine and readiness assertions. Modules 3–8 never specify them. They are restored here as a cross-cutting capability set delivered inside Supply and consumed by Demand (section 5.4). Gate G2 requires a live read-only register at week 4, so this cannot be left out.

0.2 Precedence and the non-goals

Module 1 sets the precedence order: *Applicable Law* > *Executive Decisions* > *Integrated TOR* > *BRD Module 1* > *later modules*. Module 1 also states six non-goals that Modules 3, 6, 7 and 8 directly contradict — escrow, public directories, automated selection and government endorsement among them.

Building the full scope therefore requires the Steering Committee to formally amend Module 1's non-goals. This PRD assumes that amendment and records it as **D-01**. Until it is signed, the delivery team is building against a specification that forbids part of what it asks for.

0.3 Regulated activity

Applicable Law sits above every other document in the precedence order. Three capabilities in the scope are regulated and cannot be performed by the platform itself:

Capability	Regulated activity	Platform's actual role
Escrow and settlement (Demand, Financing)	Holding and transmitting client funds	Instruct, record and verify. A CBN-licensed partner holds funds.
Factoring, outcomes-based capital, income share agreements (Financing)	Lending and investment	Originate, score and record. A licensed lender books the facility.
Binding arbitration (Disputes)	Rendering enforceable awards	Case management, evidence custody and award registration. An accredited institution administers the arbitration.

These are delivered as **integration boundaries**, not as scope reductions. Every requirement below is written so the platform holds the evidence and the instruction while the licensed partner holds the money or the legal authority. Partner selection is a Ministry and consultant dependency (**D-02**).

0.4 Marking

Unresolved conflicts are marked **[DECISION REQUIRED]** inline with a recommended default, and consolidated in section 10.

1. Vision and problem statement

1.1 Vision

A single national platform that carries a Nigerian service export from first demand signal to verified, counted outcome: finding the buyer, proving the supplier, clearing the regulatory path, financing the work, promoting the ecosystem, resolving what goes wrong, and measuring all of it once.

1.2 The problems addressed

#	Problem	Domain that answers it
P1	Demand signals arrive fragmented and unqualified	Demand
P2	Buyers distrust unverified Nigerian suppliers	Demand, Supply
P3	No authoritative source for what compliance actually applies	Regulatory Trust capability
P4	Supply capability is invisible and unbenchmarked	Supply
P5	Trade incentives are disconnected from verified performance	Supply, Observatory
P6	Export statistics are fragmented and double-counted	Observatory
P7	FDI entry into service hubs is slow and multi-agency	Promotion

#	Problem	Domain that answers it
P8	Exporters cannot access working capital against contracts	Financing
P9	Cross-border disputes have no affordable resolution route	Disputes

1.3 Success measures

Measure	Year 1	Year 2	Source of truth
Verified exporters and talent onboarded	10,000	30,000	Canonical Actor Registry
Exporters advancing at least one readiness level	30%	55%	Supply diagnostics
Regulatory traceability of verified credentials	100%	100%	Evidence Vault
Incentive disbursements with a passing audit token	100%	100%	Observatory reconciliation
Qualified opportunities published	[DECISION REQUIRED – D-03]		Demand
Share of onboarded supply outside Lagos and FCT	[DECISION REQUIRED – D-03]		Observatory inclusion analytics

[DECISION REQUIRED] D-03 — the source sets supply-side targets only. Without a demand target and an inclusion target, every KPI can be met while producing no trade and no regional spread. **Recommended default:** Secretariat sets both at G1.

2. Scope

2.1 In scope

Domain	Delivered capability
Foundation	SSO and MFA, canonical actor registry with deduplication and NATEP ID issuance, organisation delegation, evidence vault with zero-duplicate storage, granular consent engine, immutable disclosure packages, controlled taxonomies, workflow and SLA engine, notification service, API gateway, event bus, tamper-evident audit, settlement instruction service
Demand	Buyer onboarding with just-in-time verification, structured RFP and opportunity lifecycle, taxonomy-bound service classification, explainable matchmaking, trust-gated bidding, proposal management, consented disclosure, escrow instruction and milestone tracking, outcome verification and attribution
Supply	Exporter and talent onboarding, capability profiling, capacity and freshness tracking, regulatory credentialing and verification, requirements register, wizard, pathways, change alerts and readiness assertions , readiness diagnostics and tiering, trust badging and entitlements, intervention mapping, incentives and trade facilitation
Observatory	Real-time indicator pipeline, multi-dimensional trade aggregation, inter-agency workspaces (CBN, FIRS, NEPC, NEXIM, NBS, FMITI), anomaly detection, reconciliation and single-count protocol, inclusion and bottleneck analytics, policy simulation, incentive audit and anti-leakage

Domain	Delivered capability
Promotion	Investor concierge and landing pad, multi-agency fast-track routing, trade mission and delegation management, B2B matchmaking, MOU and commitment tracking, consent-based public ecosystem showcase
Financing	Contract and invoice factoring origination, automated repayment sweep instruction, outcomes-based capital and upskilling tranches, placement verification, capital provider dashboards, portfolio risk engine
Disputes	Online dispute resolution and structured negotiation, escrow hold instruction, accredited arbitrator workspace, evidence custody, award registration and execution instruction, sanctions and integrity register

2.2 Out of scope

1. Migration of historical agency data, unless a named dataset is agreed at G1.
2. Replacement or modification of any agency's internal systems.
3. Custody or transmission of funds by the Gateway itself (section 0.3).
4. Creation of statutory obligations. The register compiles and routes guidance owned by competent authorities.
5. Hardware, connectivity and agency-side change management beyond the training in section 9.

2.3 Boundaries retained from Module 1

Three of Module 1's non-goals survive the full-scope amendment and remain binding, because they protect the platform's legal position rather than its scope:

- **No autonomous award.** Scoring, matching and pre-qualification are decision support. No contract is awarded, no actor disqualified, no grant approved without a recorded human decision at the point of effect.
- **No direct legal contracting.** The platform records contract metadata and document hashes. Execution happens outside it.
- **No opaque quality rating.** Every badge and tier must state what was verified, by whom and when. Names implying government endorsement of quality are replaced (**D-06**).

3. Users

3.1 External

Individual service exporter. Freelancer or independent professional, often without CAC registration. Needs a verification route that does not require corporate registration, plain-language compliance guidance, and control over disclosure.

Service firm or agency. Holds CAC, TIN and some certifications. Needs honest diagnostics, a specific improvement path, and access to qualified demand.

Aggregator or talent pool operator. Represents many individuals. Needs delegation without holding members' credentials, and attribution for outcomes sourced.

International buyer. Needs fast onboarding, structured requirement capture, a defensible shortlist, and clear evidence of what has been verified.

Foreign investor. Establishing a service operation in Nigeria. Needs one application route and visible clearance status across agencies.

Capital provider. DFI, bank or impact investor. Needs portfolio yield, default rates and verified performance data.

Training or intervention provider. Needs correctly targeted participants and rule-checked eligibility.

3.2 Institutional

Demand officer, regulatory content drafter, competent authority focal, data steward, independent verification officer, incentive administrator, trade mission coordinator, agency analyst (CBN, FIRS, NEPC, NEXIM, NBS), accredited arbitrator, ADSPA officer, system administrator.

3.3 Segregation of duties

Enforced in software, not policy. These are acceptance criteria, not guidance.

Action	Initiated by	Independent decision by	System guard
Demand signal submission	Buyer or partner	Demand officer	Auto-promotion blocked; status Pending Qualification
Match scoring	Matching engine	Demand officer	Output advisory; automated transmission disabled
Disclosure of supplier data	Referral workflow	The data subject	403 without an active consent grant
Outcome report	Exporter or buyer	Independent verification officer	Self-reported value Provisional; excluded from Observatory
Regulatory content change	Content drafter	Competent authority focal	Stays Draft until signed off
Actor merge	Deduplication engine	Data steward	Blocked in the 70–84% match band
Audit log export	System administrator	ADSPA officer	Dual-key; unilateral extraction blocked
Incentive disbursal	Rules engine pre-qualification	NATEP/NEPC administrator	Automated pass alone never disburses
Escrow release	Buyer approval or award	Licensed settlement partner	Platform instructs; partner executes
Exporter suspension	Sanctions engine	Compliance officer or tribunal award	Automated suspension blocked without a recorded decision

4. Core journeys

J1 — Buyer: registration to award

1. Registers with corporate email; browses without document blockers at the lowest tier.
2. Attempts a high-value action (publish an opportunity, view unmasked profiles).
Just-in-time verification triggers: open registries first (LEI, DUNS, Companies House, VIES), document verification as fallback, manual review queue if both fail. The account is never locked out.
3. Publishes a structured opportunity bound to UN CPC and GATS mode. Free-text service categories rejected.
4. Matching returns an explainable ranked candidate set with factor contributions and exclusions.
5. Demand officer approves the shortlist. Nothing transmits without that approval.
6. Consent requests go to shortlisted suppliers; on grant, field-limited expiring disclosure packages are released.
7. Proposals received, evaluated, contract awarded. Metadata and document hash recorded.
8. Escrow instruction issued to the licensed partner; funding confirmation returns as an event.
9. Milestones approved against vault-held evidence; release instructions issued per milestone.
10. Outcome verified independently and counted once.

J2 — Exporter: registration to verified trade

1. Registers unblocked; receives UAID and public NATEP ID.
2. Identity verified through NIMC (individual) or CAC and FIRS (firm); adapter failure yields provisional status rather than a blocked registration.
3. Builds capability profile against taxonomy; declares quantified capacity with a freshness window.
4. Completes the requirements wizard; receives a personalised regulatory pathway by service type, mode and destination market.
5. Uploads credentials once; hybrid verification (regulator API, else document verification) produces hashed, vault-indexed evidence.
6. Completes readiness diagnostic; receives tier placement and an evidence-linked gap list, with intervention referrals where eligible.
7. Tier and verified credentials unlock bidding entitlements and incentive eligibility.
8. Bids, wins, delivers against milestones, submits deliverable evidence.
9. Applies for incentives; pre-qualification checks verified performance before administrator review.
10. May draw pre-financing against an awarded contract through Financing.

J3 — Regulator: authoring a requirement

1. Drafter creates a requirement record: plain-language summary, official channel, applicability criteria, evidence expectations, source citation, classification.
2. Record stays Draft. Not visible to any exporter.
3. Routed to the competent authority focal; multi-tier approval where configured.
4. Published with version and effective date; prior version superseded, never deleted.
5. Change engine computes impact across pathways, live opportunities and readiness assertions; raises review tasks and notifies affected holders.
6. Dependent assertions are flagged for revalidation rather than silently voided.

J4 — Secretariat: outcome verification and single count

1. Outcome reported by exporter, buyer or partner. Enters Provisional; excluded from all published figures.
2. Evidence submitted and classified by strength.
3. Rule-routed to an independent verifier, never the reporting party.
4. Duplicate-value checks run against verified outcomes and against reconciliation sources.
5. Counted exactly once; partner contribution recorded as attribution lineage, not as a second outcome.
6. Observatory ingests verified outcomes only.

J5 — Analyst: producing a national figure

1. Selects dimensions: service category, GATS mode, destination corridor, region, actor tier, period.
2. Pipeline returns aggregates with confidence weighting and provenance.
3. Suppression and dominance rules applied before rendering.
4. Variance against NEPC, NEXIM, CBN, FIRS and NBS sources shown as documented reconciliation, not silently merged.
5. Report exported with method notes attached.

J6 — Investor: landing application

1. Authenticated foreign enterprise submits corporate documentation, sector focus and projected job creation.
2. Investor Application Token generated; clearance payloads routed to NIPC, NEPZA and FIRS endpoints.
3. Investor tracks per-agency clearance status in one view.
4. Landing outcome and commitments recorded and tracked against subsequent activity.

J7 — Exporter: contract pre-financing

1. Exporter submits an awarded contract with a confirmed escrow hold.

2. Risk engine scores contract validity, buyer standing and delivery history.
3. Advance offer generated within policy limits; exporter accepts.
4. Lien instruction issued against the escrow contract with the licensed partner; facility booked by the lender.
5. On milestone release, repayment sweep instruction executes before net disbursement to the exporter.

J8 — Dispute: filing to award

1. Party files a dispute against an active contract milestone.
 2. Hold instruction issued to the settlement partner; disputed funds frozen.
 3. Structured negotiation window opens with assisted settlement proposals.
 4. On agreement, a settlement record is generated and a release instruction issued per the agreed split.
 5. On expiry without agreement, the case escalates to arbitration; an accredited arbitrator is appointed under the administering institution's rules.
 6. Evidence exchanged through the vault under controlled access.
 7. Award issued, registered with its cryptographic signature, and executed as a release instruction.
 8. Confirmed breach or non-compliance flows to the sanctions register and, on a recorded compliance decision, to profile suspension.
-

5. Functional requirements

Requirement IDs: **FND** Foundation, **DEM** Demand, **SUP** Supply, **REG** Regulatory Trust (delivered within Supply), **OBS** Observatory, **PRO** Promotion, **FIN** Financing, **DSP** Disputes.

The source numbers the same Foundation requirement two different ways across its two FRD versions (FR-M2-04 is Taxonomies in one and the Vault in the other). This scheme replaces both. A mapping table from every source requirement ID to this scheme is delivered at G1 so TOR traceability is preserved (**D-15**).

5.1 Foundation

FND-01 — Identity and access. One OIDC provider for every domain; no domain holds local credentials. Argon2id hashing (64 MB, 3 passes, 4 threads). Access tokens expire in 15 minutes, refresh tokens in 24 hours with rolling renewal. Lockout for 30 minutes after 5 consecutive failures. MFA via TOTP or WebAuthn mandatory for administrative, verifier and institutional roles. Context switching between affiliated entities issues a newly scoped token and invalidates the prior one without re-authentication. *Accepted when:* a user holding both an

individual and a firm affiliation switches context and the resulting token carries only the target scope; an institutional role cannot complete login without a second factor.

FND-02 — Canonical actor registry and deduplication. One authoritative record per individual, firm, agency, buyer, investor and capital provider. Immutable internal identifier (UAID) plus a public NATEP ID. Verification via NIMC for individuals, CAC and FIRS for Nigerian businesses, LEI or DUNS for foreign entities. Deduplication on deterministic keys plus Jaro-Winkler and Levenshtein distance across name, address, tax identifier and email. *Thresholds:* 85% or above blocks creation and queues for steward review; 70–84% creates as Pending Verification and queues; below 70% with a valid government identifier verifies automatically. *Lifecycle:* Provisional → Pending Verification → Verified → Suspended → Archived, extended with a Rejected terminal state and a documented reinstatement path from Suspended. Every status used elsewhere in the source (Duplicate Suspect, Pending Manual Review, Provisional Pending Async Check, Pending Compliance Review) maps into this model at G1. *Accepted when:* an 88% near-duplicate is blocked and appears in the steward queue with both records side by side; an adapter outage produces a provisional record rather than a failed registration.

[DECISION REQUIRED] **D-04 — Public identifier format.** The source offers **NT-I26-8942A** and **N-I26-8942A**, then uses **NT-INV-**, **NT-EXP-**, **NT-BUY-** and **NT-SYS-** in its own samples. **Recommended default:** Option A, with the entity-type character extended to cover every actor type in the model, fixed at G1. Geographic data stays in metadata and is never embedded in the identifier.

FND-03 — Organisation delegation. Time-bound scoped delegation by an entity administrator without credential sharing. Maximum 365 days without recertification; daily expiry sweep; revocation invalidates linked sessions immediately. *Accepted when:* revoking a delegation while the delegate holds an active session causes their next request to fail authorisation.

FND-04 — Evidence vault. Malware scanning before indexing, with quarantine and security alert on detection. SHA-256 computed per upload. On hash match the reference counter increments and the existing document links to the new context; on no match the file is encrypted (AES-256-GCM) and stored. Access only via signed short-lived URLs; direct object store access blocked. Maximum 15 MB; PDF, PNG, JPEG, DOCX permitted; executables rejected on content inspection, not extension. *Accepted when:* the same certificate uploaded in two contexts stores one binary and two references.

[DECISION REQUIRED] **D-05 — Cross-tenant deduplication leak.** Matching hashes across all actors allows a party to infer that a given file already exists in the system. **Recommended default:** deduplicate within an actor and its delegated entities; maintain a global hash index for fraud detection readable by stewards only, never exposed through API response or timing difference.

FND-05 — Consent engine. Purpose-bound, recipient-specific, field-limited grants. Requests itemise requesting entity, recipient, exact fields, purpose and expiry in plain language. Pre-ticked and blanket consent invalid. Grants are signed records capturing timestamp, actor, field array and purpose. Middleware evaluates consent on every cross-domain request; absent or expired consent returns 403. Revocation is immediate and invalidates dependent disclosure packages and caches. *Accepted when:* revoking consent while a recipient holds an open package causes their next fetch to fail.

FND-06 — Disclosure packages. Minimum-necessary envelopes built only from consented fields, non-consented attributes masked at serialisation. Unmodifiable TTL; expired packages return 410. Every access logs recipient, address, timestamp and package identifier.

[DECISION REQUIRED] **D-07 — TTL.** 15 minutes is unusable for a buyer reviewing a shortlist across time zones. **Recommended default:** configurable per purpose, defaulting to 7 days for shortlist review and 15 minutes for one-time administrative views, with revocation still immediate.

FND-07 — Taxonomies and master data. Versioned code tables for services, sectors, occupations, GATS Modes 1–4, jurisdictions, currencies and statuses, mapped to UN CPC Ver. 2.1 and ISIC Rev. 4. Semantic versioning; retired codes deprecated, never deleted. Hardcoded option lists prohibited in any codebase; all selectors consume the cached API.

FND-08 — Workflow and SLA engine. Case instances linked to a parent object and routed to role queues. SLA timers use a national business calendar excluding weekends and public holidays. Warning at 80%, supervisor reassignment and escalation at breach. Completion requires mandatory transition parameters and evidence references.

FND-09 — Notification service. Shared across all domains. Email, in-app and SMS where reachability requires it. Per-user preferences and quiet hours, delivery tracking and retry. Content carries no personal data beyond what the recipient is already entitled to see. *The source prohibits per-domain notification systems but never specifies the shared one; this closes that gap.*

FND-10 — API gateway, event bus and tamper-evident audit. All traffic through the gateway for token introspection, rate limiting and firewall inspection. State changes publish standard JSON envelopes to the event bus. Audit entries capture actor UAID and NATEP ID, UTC timestamp, action, target, pre-state and post-state hashes, each digest chained to its predecessor. Audit storage is write-once; update, delete and truncate blocked at database privilege level.

[DECISION REQUIRED] **D-08 — Event envelope shape.** The source's JSON Schemas and sample payloads disagree on field names (`timestampUTC` vs `eventTimestamp`, `payload` vs `data`), identifier formats and enum values. **Recommended default:** adopt the sample shape

(*eventId*, *eventType*, *eventTimestamp*, *producer*, *actor*, *data*, *context*), publish as the single schema at G1, validate every producer in CI. Payloads carry identifiers only — no tax numbers, registration numbers or addresses, which the current samples expose.

FND-11 — Settlement instruction service. The single point through which every domain instructs the licensed settlement partner. Issues typed instructions (hold, fund, release, refund, lien, sweep), records the partner's acknowledgement and outcome as events, and reconciles instruction state against partner state on a schedule. No domain calls the partner directly. Double-entry records maintained for every instruction and outcome. *Accepted when:* an instruction with no acknowledgement inside the agreed window raises an operational alert and blocks dependent state transitions rather than assuming success.

5.2 Demand

DEM-01 — Buyer onboarding and just-in-time verification. Open registration on corporate email domain validation. Verification triggers only on a high-value action. Two-stage hybrid pipeline: open public registries first (GLEIF LEI, Companies House, VIES), then document verification with extraction and tamper analysis, then a manual review queue. Failure never locks a buyer out of their own account. Verified buyers are provisioned a UAID through FND-02. *Tiers state what was verified, not a quality judgement (D-06).*

DEM-02 — Opportunity and RFP lifecycle. Structured creation requiring title, statement of work, budget range, target completion, GATS mode and UN CPC code. Taxonomy bound to FND-07; unmapped free-text categories rejected at the gateway. Explicit audited state machine: Draft → Published → Matching Active → Shortlisting → Awarded → Fulfilled → Closed. Deadline expiry transitions automatically and blocks further submissions.

DEM-03 — Signal intake. Four routes — public form, assisted officer capture, external API, secure batch upload. Every route lands Pending Qualification with the route recorded.

DEM-04 — Qualification. Deduplication against open signals, checklist with recorded rationale, risk-tier escalation. Decisions attributable to a named officer. Rejections retain rationale.

DEM-05 — Opportunity Criteria Package. Criteria typed as mandatory, preferred, negotiable or informational, with GATS mode, capacity requirement and timeline. Immutable and versioned; new versions trigger impact analysis against existing matches and referrals.

DEM-06 — Explainable matchmaking. Vector similarity over opportunity and capability representations, filtered by entitlement, then scored on published weights: capacity and bandwidth 30%, verification depth 30%, verified past performance 20%, skill and taxonomy alignment 20%. Every result carries factor contributions and plain-language exclusion reasons. Bias checks on protected and proxy attributes. Manual adjustment is an audited event requiring

a recorded reason. *Accepted when:* a supplier can see why they were or were not matched in terms they can act on.

[DECISION REQUIRED] **D-09 — Readiness multiplier.** Module 4 applies a 1.25 matchmaking multiplier for the top readiness tier; Module 3's weights make no room for it. **Recommended default:** the multiplier is folded into the verification-depth factor rather than applied on top, so total scores remain bounded and explainable.

DEM-07 — Entitlement-gated bidding. Response rights derived from live Supply state at submission. Blocked attempts return an explicit reason and the exact action required to unlock. Thresholds are configuration, not code.

DEM-08 — Human shortlisting. No referral transmits without a recorded officer approval. No timer, threshold or default sends on the officer's behalf.

DEM-09 — Consented disclosure and engagement. Disclosure package linked to an active grant, referral transmitted, buyer acknowledgement, proposal lifecycle tracked. Proposals encrypted at rest and visible only to entitled parties.

DEM-10 — Escrow instruction and milestones. On award, milestone schedule defined in the contract currency. Funding instruction issued through FND-11; work commencement is gated on the partner's funding confirmation event, never on an assumed state. Deliverable evidence submitted to the vault with a SHA-256 reference. Buyer approval issues a release instruction. Every state change publishes an event for the Observatory. *Accepted when:* a partner funding failure leaves the milestone unfunded and notifies both parties, with no work-commencement signal sent.

DEM-11 — Conversion and outcome verification. Interview and due diligence tasks, contract metadata with document hash, commencement confirmation. Outcome evidence rule-routed to an independent verifier. Duplicate-value checks, single-count accounting, partner attribution lineage. Self-reported values stay Provisional.

5.3 Supply

SUP-01 — Onboarding and capability profiling. Unblocked registration with deferred verification. Capability portfolios bound to UN CPC and ISIC, with operational scale, delivery history, team qualifications and evidence tiers. Privacy-by-default on every field.

SUP-02 — Capacity and freshness. Quantified capacity in units, hours or headcount with availability windows and automatic exclusion of stale declarations from pool and match queries.

SUP-03 — Supply pools. Rule-based pools by service, geography and evidence tier, with capacity confirmation queries to members.

SUP-04 — Regulatory credentialing. Hybrid verification of corporate standing (CAC), tax status (TIN) and professional licences (NITDA/NDPC, COREN, CIBN, ISO and others) via regulator API where available, document verification as fallback. Verified credentials hashed and vault-indexed to prevent reuse. Expiry tracked with a 30-day renewal warning before any entitlement degradation, and degradation is never silent.

SUP-05 — Readiness diagnostics and tiering. Five weighted parameters: export capacity 25%, financial stability 20%, quality management 20%, cross-border delivery experience 20%, legal and IP protection 15%. Score maps to three ordinal levels (under 50, 50–79, 80 and above). Recalculation on profile or credential change. Downgrades on expiry or failed compliance check, with notice.

[DECISION REQUIRED] **D-06 — Two competing ladders and the individual track.** The source gates the same actions twice: badges by profile completion percentage, and readiness levels by diagnostic score, with no precedence rule. It also requires CAC and TIN for verified status, permanently excluding individual freelancers — the talent NATEP is named for.

Recommended default: one ladder driven by the diagnostic, with an individual track whose evidence requirements are equivalent but not corporate (NIN plus professional credential plus verified delivery history in place of CAC plus TIN). Tier names state what was verified rather than conferring a government quality rating.

SUP-06 — Entitlements. Tier drives bidding ceilings, match placement, incentive eligibility and financing eligibility. Every entitlement change publishes an event. The dashboard shows current permissions, current score and the exact next action to advance.

SUP-07 — Intervention mapping. Programme blueprints, provider eligibility, participant selection, resource tracking, reassessment cycles, and referral into Financing where an intervention is capital-backed.

SUP-08 — Incentives and trade facilitation. Grant, tax credit and trade mission applications. Automated pre-qualification against verified performance and compliance state, then mandatory administrator review. Issued incentives recorded in the vault and tracked against lifetime performance. *Pre-qualification never disburses on its own.*

[DECISION REQUIRED] **D-10 — Incentive eligibility basis and currency.** The source restricts grants to exporters with on-platform escrow volume, which excludes every exporter paid through normal banking channels, and compares a naira grant request against a dollar escrow figure with no FX rule. **Recommended default:** eligibility accepts verified export evidence from any channel, not only platform escrow; all thresholds evaluated in a single base currency using the CBN reference rate on the application date, with the rate stored on the record.

5.4 Regulatory Trust (delivered within Supply)

Required by the TOR and Module 1, absent from Modules 3–8, and required live at Gate G2.

REG-01 — Requirements register. Classification across statutory, professional, fiscal, FX and settlement, and buyer-driven standards. Record schema: plain-language summary, official channel, applicability criteria, evidence expectations, source citation, effective date, review date, authoring authority.

REG-02 — Institutional authoring and validation. Per-agency queues, multi-tier approval, review calendars, disclaimer management. Content remains Draft until the competent authority signs off. The platform cannot publish a requirement an agency has not approved.

REG-03 — Wizard and pathway engine. Dynamic questionnaire over actor archetype, service type, export mode and destination market, producing an ordered personalised pathway with evidence gaps identified.

REG-04 — Exporter readiness workspace. Private checklist, gap list, assessment report, bank and FX settlement readiness. Private by default; nothing visible to buyers without an explicit disclosure.

REG-05 — Change alert and invalidation. Detection of revisions, impact analysis across pathways, live opportunities and assertions, auto-generated review tasks, notification to affected holders. Dependent assertions flagged for revalidation, never silently voided.

REG-06 — Readiness assertions. Purpose-bound, time-stamped, scope-limited. State what was verified, by which authority, on what date, and what is not covered.

[DECISION REQUIRED] **D-11 — G2 register content.** A live read-only register at week 4 requires validated content from the Secretariat by week 3. **Recommended default:** a named minimum sector and requirement set agreed at G1, with content as a tracked Secretariat deliverable. Without it, G2 fails on content rather than software.

5.5 Observatory

OBS-01 — Indicator pipeline. Stream ingestion from every domain within 2 seconds of emission, cleansing, confidence weighting, anonymisation. Provisional values excluded from headline figures.

OBS-02 — Multi-dimensional aggregation. GATS modes, UN CPC categories, currency corridors, destination country and economic bloc, actor tier, region and period.

OBS-03 — Reconciliation and single count. Resolution of overlapping claims across NEPC, NEXIM, CBN, FIRS, NBS and FMITI to one counted value per outcome, attribution lineage preserved. Variance against each source reported rather than silently merged.

[DECISION REQUIRED] **D-12 — Reconciliation rules.** Deduplicating export value across six institutions requires an agreed matching key and a precedence order where they disagree. This is a policy decision, not an engineering one, and it is the largest single schedule risk in the programme. **Recommended default:** the Secretariat convenes the agencies before G3 and the rules are recorded as a signed annex.

OBS-04 — Agency workspaces. Scoped read-only workspaces for CBN (FX repatriation and domiciliary inflows), FIRS (export earnings verification for zero-rated VAT and credits), NEPC (grant eligibility and certificate utilisation), NEXIM, NBS and FMITI. MFA and RBAC enforced through FND-01. No agency mutates operational records.

OBS-05 — Anomaly detection. Daily comparison of declared earnings, verified receipts and regulatory filings. Discrepancies beyond threshold raise a case and notify the assigned officer. A flag is a case, not a sanction: no automated state change to an exporter's standing without a recorded human decision.

OBS-06 — Incentive audit and anti-leakage. Every incentive application cross-checked against verified performance, compliance state and threshold policy before administrator sign-off. Audit tokens registered in the audit chain. Failures return explicit, actionable reasons.

OBS-07 — Policy simulation. Sandbox over historical trade velocity and macro indicators. Adjustable policy variables with bounded ranges, producing 12, 24 and 36-month projections. Simulation is strictly isolated: it cannot mutate live parameters, fees or thresholds. Outputs are stored as immutable scenario reports with their input assumptions attached.

OBS-08 — Inclusion and bottleneck analytics. Regional distribution funnel, demographic inclusion, and identification of where in the pipeline actors are lost.

OBS-09 — Disclosure control. Suppression where the underlying population is too small, extended with a dominance check so a single large actor cannot be inferred from a compliant group count.

OBS-10 — Statistical integrity. Every published figure states its basis — platform-observed activity, reconciled national figure, or projection — and is labelled accordingly. Platform activity is never presented as a national total.

5.6 Promotion

PRO-01 — Investor concierge and landing pad. Structured application covering corporate documentation, sector focus, proposed investment and projected job creation. Application token issued; clearance payloads routed to NIPC, NEPZA and FIRS through the gateway. Per-agency clearance status visible in one view. Agency response failures are surfaced, not hidden behind a pending state.

PRO-02 — Trade missions and delegations. Mission creation with sector focus, target markets and delegate quotas. Delegate requirements matched against verified supply to generate prioritised B2B schedules. Attendance and outcomes recorded.

PRO-03 — MOU and commitment tracking. MOUs recorded against the mission entity, with milestone tracking and conversion monitoring into subsequent contract activity.

PRO-04 — Ecosystem showcase. Public directory of Nigerian service capability, populated only by suppliers who have opted in to public listing, showing non-confidential attributes and verified status only. Contact routes through the platform rather than exposing direct details.

[DECISION REQUIRED] **D-13 — Public listing consent model.** Module 1 forbids an unmoderated public directory; Module 6 requires a global one. **Recommended default:** opt-in per supplier, per field, with a standing consent grant that can be revoked, removing the listing within the cache purge window. This satisfies Module 6's purpose without an unmoderated directory.

5.7 Financing

All financing capability is originate-score-record. A licensed lender books every facility; the platform never lends on its own balance sheet.

FIN-01 — Factoring origination. Eligibility requires an awarded contract with a confirmed hold and a minimum value threshold. Risk engine scores contract validity, buyer standing and delivery history. Advance offer generated within the policy ceiling. Acceptance issues a lien instruction through FND-11 and records the facility against the lender of record.

FIN-02 — Repayment sweep. On milestone release, principal and charges sweep to the capital provider before net disbursement to the exporter. Sweep is an instruction with confirmed outcome, and partial or failed sweeps raise a case rather than silently netting.

FIN-03 — Outcomes-based capital. Capital pools funded by providers for upskilling and placement programmes. Baseline tranche on programme start; performance tranches released on verified placement events meeting retention and threshold conditions. Verification queries platform-held placement and contract evidence.

FIN-04 — Placement verification. Evidence of contract execution, employer confirmation and salary remittance, each verifiable, before any tranche authorisation. Unverified placements do not trigger payment.

FIN-05 — Capital provider gateway. Scoped dashboards showing portfolio yield, default rates and utilisation. Read-only against operational records. Exporter-level data visible only under an active consent grant.

FIN-06 — Portfolio risk engine. Continuous default probability estimation from platform performance history. Scores are inputs to a lender's decision, never an automated credit decision on the borrower.

[DECISION REQUIRED] **D-14 — Lender of record and consumer-protection posture.** Whether facilities are booked by a single partner, a panel, or the Ministry-backed vehicle determines disclosure obligations, pricing transparency and default handling. **Recommended default:** named licensed partners per product, with pricing and default terms disclosed to the exporter before acceptance, and no cross-default into platform standing without a recorded decision.

5.8 Disputes

DSP-01 — Case filing and hold. Either party may file against an active milestone. Filing issues a hold instruction through FND-11, notifies the counterparty and opens the negotiation workspace. Held funds are visibly ring-fenced to both parties.

DSP-02 — Structured negotiation. Fixed negotiation window with offer and counter-offer capture. Assisted settlement proposals derived from contract terms and comparable resolutions are advisory and clearly labelled. Agreement produces a settlement record and a proportional release instruction.

DSP-03 — Escalation and arbitrator appointment. Expiry without agreement escalates to arbitration under the administering institution's rules. Appointment follows those rules; the platform records the appointment and any challenge, and does not itself constitute the tribunal.

[DECISION REQUIRED] **D-16 — Arbitration agreement and seat.** A binding award requires an arbitration agreement, a seat and an administering institution. The platform does not hold the contract, so the agreement must be established elsewhere. **Recommended default:** a platform terms-of-use arbitration clause with a named Nigerian seat and administering institution, drafted by counsel and accepted at onboarding, plus opt-in confirmation at award. Party autonomy over appointment must be preserved; a random-rotation sole-arbitrator assignment is not defensible.

DSP-04 — Evidence custody. Party submissions encrypted and vault-held, accessible only to the tribunal, the parties and authorised clerks. Every access logged.

DSP-05 — Award registration and execution. Signed awards registered with their cryptographic signature and full audit anchoring. Execution issues release or refund instructions per the award. Awards are immutable once registered; correction follows the institution's own procedure.

DSP-06 — Sanctions and integrity register. Confirmed breach, fraud or non-compliance with an award feeds a sanctions record. Effects on standing, listing and financing eligibility require a recorded compliance decision — automated suspension is blocked. Appeal route defined and time-bound.

6. Cross-domain data contracts

Module 1 defines eight canonical packages; Modules 3–8 ignore them and query each other's records directly, which Module 1 prohibits. With seven domains instead of four, direct coupling is the single largest architectural risk in the build. These contracts are first-class deliverables.

No domain reads another domain's database. All exchange is through immutable, versioned packages over the gateway.

Contract	Producer	Consumers	Carries	Never carries
Opportunity Criteria Package	Demand	Supply, Regulatory, Financing	Criteria by type, GATS mode, capacity requirement, timeline, version	Buyer contact details, internal risk notes
Regulatory Requirement Link	Regulatory	Demand, Supply	Versioned reference to an applicable requirement and its applicability basis	Interpretation beyond the agency's own wording
Readiness Assertion	Regulatory	Demand, Supply, Promotion	What was verified, by whom, when,	A general fitness or quality claim

Contract	Producer	Consumers	Carries	Never carries
			scope limits, expiry	
Potential Fit Evaluation	Supply	Demand	Per-criterion score breakdown, explanation, exclusions applied	A selection or binding recommendation
Capability Package	Supply	Demand, Promotion	Versioned, evidence-aware capability and capacity summary approved for disclosure	Anything outside the active consent grant
Consent Request / Grant	Foundation	All	Purpose, recipient, field list, expiry, signature	Implied or blanket permissions
Shared Disclosure Package	Foundation	Demand, Promotion, external recipients	Minimum-necessary consented fields, TTL, access log reference	Masked or non-consented attributes
Outcome / Attribution Event	Demand, authorised verifier	Observatory, Financing	Evidence-classified outcome value, attribution lineage, single-count key	A second count of an already-counted outcome
Settlement Instruction / Outcome	Foundation (FND-11)	Demand, Financing, Disputes	Typed instruction, reference, currency, amount, partner acknowledgment and result	Bank credentials or raw partner payloads

Contract	Producer	Consumers	Carries	Never carries
Entitlement State	Supply	Demand, Financing, Promotion	Current tier, active permissions, effective date	The underlying evidence itself
Sanction Notice	Disputes	Supply, Promotion, Financing	Sanction type, basis, effective date, appeal status	Tribunal evidence or deliberations

Versioning rule. A new version triggers impact analysis against every object that consumed the prior version. Consumers are notified, never silently upgraded.

Failure rule. If a contract cannot be produced — consent absent, requirement superseded, capacity stale, instruction unacknowledged — the consumer receives an explicit typed failure, never a partial or stale package.

7. Non-functional requirements

7.1 Performance and availability

Metric	Target	Condition
Uptime — identity, consent, gateway	99.9% monthly	Core shared services
Uptime — financial, tribunal, public showcase	99.95% monthly	Per Modules 6–8
Authentication response	under 200 ms	p95 at 2,000 concurrent users
Evidence hash lookup	under 30 ms	p95
Match and shortlist render	under 500 ms	p95, top-20 candidates
Entitlement recalculation	under 500 ms	On profile or credential change

Metric	Target	Condition
Readiness diagnostic	under 2 s	Computation and display
Document verification	under 15 s	Extraction and tamper check
Stream ingestion to dashboard	under 2 s	Event emission to aggregate update
Analytical query	under 1.5 s	p95, multi-year aggregates
Settlement instruction dispatch	under 10 s	Platform side; partner latency reported separately
Event throughput	5,000/sec sustained, 10,000/sec peak	Without backpressure
Concurrency	2,000 buyer sessions, 5,000 supplier sessions	Peak windows
RPO / RTO	under 15 min / under 4 hours	Regional failure

Partner-dependent timings (settlement, agency clearance) are measured to the platform boundary. End-to-end targets require partner SLAs, which are a contractual dependency (D-02).

7.2 Security

TLS 1.3 in transit, internal and external. AES-256-GCM at rest across databases, vault and backups. Application-layer envelope encryption for sensitive identifiers before persistence. Default masking in every interface with unmasking permission-logged. Multi-signature authorisation for settlement instructions above threshold. Two independent penetration tests, at G4 and before G5, with no unresolved High or Critical findings at G5.

7.3 Data protection (NDPA 2023)

Lawful basis registry per processing purpose. DPIA baselined at G1 and updated at each gate. Data minimisation enforced in field design.

The following are statutory obligations absent from the source document and are in scope:

- **Subject access requests** with a statutory response clock, covering every domain and the vault.
- **Rectification and erasure**, including the interaction with the immutable audit chain. Resolution: erase content, retain a tombstoned hash, document and obtain ADSPA approval.

- **Retention schedules** per data category with automated expiry. No category retained indefinitely by default. Financial and tribunal records carry statutory minimums that override deletion requests, and that conflict must be documented.
- **Breach notification** — detection, assessment and regulator notification within the statutory window.
- **Cross-border transfer basis.** Disclosure to foreign buyers, investors and capital providers is a transfer requiring a documented basis beyond consent alone.

[DECISION REQUIRED] D-17 — **Data residency.** Not stated anywhere in the source, and it determines cloud region, provider and architecture. **Recommended default:** in-country primary storage for personal, evidence and financial data, confirmed by ADSPA at G1 before any infrastructure commitment.

7.4 Financial and legal compliance

AML and KYC obligations attach to the licensed partner, with the platform supplying verified identity attributes and transaction context under a documented data-sharing agreement. Sanctions and PEP screening on counterparties at onboarding and periodically. Double-entry records for every instruction. Records retained per financial-services statutory minimums. Arbitration records retained and anchored per the administering institution's requirements.

7.5 Accessibility and reach

WCAG 2.1 AA for all public and exporter-facing interfaces. Mobile-first: much of the target supply base will use a phone. Tolerance for intermittent connectivity — resumable uploads, offline-safe form state, no silent data loss on a dropped connection.

[DECISION REQUIRED] D-18 — **Language coverage.** The source is English-only. **Recommended default:** English at launch with the interface internationalised from day one, so additional languages are a content task rather than a rebuild.

7.6 Interoperability and resilience

Adapters to NIMC, CAC, FIRS, NEPC, CBN, NIPC, NEPZA, GLEIF, Companies House and the settlement partner sit behind circuit breakers: open after 5 consecutive failures or timeouts beyond 5 seconds, fall back to asynchronous batch retry, degrade gracefully by marking verification provisional rather than blocking onboarding. Government database outages are assumed, not treated as exceptions. Financial instructions are idempotent and reconciled, never retried blindly.

7.7 Operability

Structured logging, distributed tracing, per-domain dashboards, alerting on SLA breach, adapter circuit state and instruction reconciliation gaps. Runbooks for every operational failure mode delivered at G6.

8. Architecture constraints

1. **Single-Platform Mandate.** One identity store, one actor registry, one evidence vault, one consent engine, one audit chain, one notification service, one settlement instruction service. No domain implements its own.
 2. **Foundation leads.** Foundation contracts and event schemas are frozen before domain teams build against them. With seven domains in parallel, a moving Foundation is the primary programme risk.
 3. **Contract-first.** Every cross-domain interaction is specified as a versioned contract (section 6) before implementation, and validated in CI.
 4. **Instruction, not custody.** No domain touches funds. All financial effect flows through FND-11 as instructions with confirmed outcomes.
 5. **Human decision points are structural.** Where segregation of duties requires a human decision (section 3.3), the system has no code path that completes the action without one.
 6. **Events carry identifiers, not payloads.** Personal, tax and registration data is fetched under authorisation, never broadcast on the bus.
-

9. Release plan

The 26-week schedule from Module 1 is retained. Gate timings follow Module 1, which places G5 at week 22; Modules 5–8 say week 20 and are superseded.

Weeks	Release	Gate	Objective evidence
1–2	Design and baseline alignment	G0 (wk 1), G1 (wk 2)	Governance charter; Ministry-owned cloud and repository accounts live; decision register closed; this PRD

Weeks	Release	Gate	Objective evidence
			signed off; architecture blueprint, data model, frozen event schema and contract definitions, DPIA baseline, requirement ID mapping
3–4	First rendition	G2 (wk 4)	Public landing page deployed; read-only requirements register live with agreed starter content; identity and taxonomy services live; CI/CD proven
5–10	Foundation and alpha	G3 (wk 10)	Foundation operational including settlement instruction service; Demand intake, qualification and opportunity lifecycle; Supply onboarding, credentialing and entitlements; Regulatory authoring; reconciliation rules annex signed; settlement partner integration in test
11–16	Integrated beta	G4 (wk 16)	Cross-domain contracts functioning; consented capability transfer verified; matchmaking live; escrow instruction end-to-end in partner

Weeks	Release	Gate	Objective evidence
			sandbox; Observatory pipeline and agency workspaces; Promotion showcase; first penetration test
17–22	Controlled field pilot	G5 (wk 22)	UAT across live pilot scenarios covering all seven domains; financing and dispute flows exercised with the licensed partner; security audit clear of High and Critical findings; service desk operating
23–26	Hardening and handover	G6 (wk 26)	Independent test sign-off; source code and repository transfer; staff competency confirmed; runbooks delivered; operational transition complete

Delivery structure. Seven domain squads plus a Foundation squad. Foundation runs one increment ahead throughout. Domain squads do not begin against unfrozen contracts.

Scope-at-risk against the 26 weeks. Financing, Disputes and the investor landing pad each depend on an external party being contracted, integrated and tested. Their gate evidence is achievable only if partner selection completes by week 6 (**D-02**). If it does not, these three land after G6 regardless of team size, and the gate evidence must be restaged rather than the delivery compressed.

Training and handover. Role-based training for Secretariat officers, data stewards, agency focals, verifiers, incentive administrators and arbitration clerks across G5 and G6, with recorded sessions and written runbooks.

10. Open decisions register

Each item is a scope, policy or legal question the source leaves unresolved or self-contradictory. This register is the acceptance condition for G1.

ID	Decision	Owner	Needed by	Recommended default	If unresolved
D-01	Formal amendment of Module 1 non-goals to permit escrow, financing, arbitration and public directory	Steering Committee	G1	Amend and reissue Module 1	Build proceeds against a spec that forbids part of itself
D-02	Licensed partner selection — settlement, lending, arbitration institution	Ministry / consultant	Week 6	Named partners with SLAs before G3	Financing, Disputes and escrow cannot complete by G6
D-03	Demand volume and regional inclusion targets	Secretariat	G1	Set both at G1	Supply KPIs met with no trade and no regional spread
D-04	Public identifier format and entity-type coverage	ADSPA	G1	Option A, extended to all actor types	Identifier rework after data exists
D-05	Cross-tenant deduplication exposure	ADSPA	G2	Deduplicate within actor scope; global	Information leak between

ID	Decision	Owner	Needed by	Recommended default	If unresolved
				index steward-only	unrelated parties
D-06	Single tier ladder, individual (non-CAC) track, badge naming	Secretariat / TWG	G3	Diagnostic-driven ladder with equivalent individual track	Freelancers structurally excluded; two conflicting gates
D-07	Disclosure package TTL per purpose	ADSPA / Secretariat	G3	Configurable; 7 days for shortlist review	Buyers cannot complete review
D-08	Canonical event envelope schema	ADSPA	G1	Sample shape, identifiers only, validated in CI	Producers diverge; Observatory ingestion breaks
D-09	Readiness multiplier in match scoring	Demand TWG	G3	Folded into verification-depth factor	Unbounded, unexplainable scores
D-10	Incentive eligibility basis and FX rule	Secretariat / NEPC	G3	Any verified export evidence; single base currency at CBN rate	Off-platform exporters excluded; currency mismatch in grant decisions
D-11	Requirements register starter content for G2	Secretariat	Week 3	Named minimum set agreed at G1	G2 fails on content

ID	Decision	Owner	Needed by	Recommended default	If unresolved
D-12	Inter-agency reconciliation and single-count rules	Secretariat + CBN, FIRS, NEPC, NEXIM, NBS	G3	Signed annex before G3	Observatory cannot perform its core function
D-13	Public listing consent model	ADSPA / Secretariat	G4	Opt-in per supplier and per field, revocable	Unmoderated directory, or Promotions empty
D-14	Lender of record and consumer-protection posture	Ministry / legal counsel	G4	Named partners, disclosed terms, no automatic cross-default	Regulatory exposure on every facility
D-15	Requirement ID mapping from source modules to this scheme	Delivery team	G1	Mapping table at G1	Traceability matrix cannot be produced
D-16	Arbitration agreement, seat and administering institution	Legal counsel	G4	Terms-of-use clause, Nigerian seat, named institution, party autonomy preserved	Awards unenforceable
D-17	Data residency	ADSPA	G1	In-country for personal, evidence and financial data	Infrastructure committed on a wrong assumption
D-18	Language coverage	Secretariat	G1	English at launch, international	Retrofit cost or exclusion of

ID	Decision	Owner	Needed by	Recommended default	If unresolved
				sed from day one	non-English speakers

11. Assumptions, dependencies and risks

11.1 Assumptions

1. The Ministry owns cloud accounts, repositories and domains from G0, and delivery works inside them.
2. Agency focals at each competent authority are named before G2 and available within the review windows in REG-02.
3. The Secretariat supplies register starter content for G2 and the pilot cohort for G5.
4. Reconciliation rules are agreed as a policy decision by the agencies, not designed by the delivery team.
5. Sandbox access for NIMC, CAC and FIRS is available by week 5; production access by G4.
6. Licensed partners are contracted by week 6 with integration documentation and a test environment.
7. Legal counsel drafts the arbitration clause and the cross-border transfer basis; the delivery team implements, it does not advise.

11.2 Dependencies with schedule impact

Dependency	Needed by	Impact if late
Cloud and repository accounts	Week 1	G0 fails; everything shifts
Closed decision register and frozen contracts	Week 2	Seven squads build against a moving target; rework at scale
Register starter content	Week 3	G2 fails
Government API sandbox access	Week 5	Verification built against mocks; integration risk moves to G4

Dependency	Needed by	Impact if late
Licensed partner contracts and sandboxes	Week 6	Financing, Disputes and escrow slip past G6
Reconciliation rules annex	Week 10	Observatory ships as platform-activity reporting only
Named pilot cohort	Week 16	G5 pilot cannot run
Agency focal availability	Continuous	Regulatory content stalls in Draft; the register ships empty

11.3 Principal risks

Risk	Effect	Mitigation
Foundation contracts not frozen before parallel build	Systemic rework across seven domains	Contract-first gate at G1; no squad starts against draft contracts
Licensed partner not contracted in time	Three domains cannot meet gate evidence	D-02 escalated at G1; restaging agreed in advance rather than discovered at G5
Agency non-participation	Register and Observatory both hollow	Steering Committee escalation path defined at G1; content tracked as a Secretariat deliverable
Reconciliation rules never agreed	Observatory reduces to a platform dashboard	OBS-10 labelling; scope reduction agreed, not discovered
Non-goals never formally amended	Delivered scope contradicts the governing document	D-01 closed at G1
Government adapter instability	Onboarding blocked	Circuit breakers and provisional verification in FND-02 and 7.6
Settlement instruction and partner state divergence	Funds state unknown; disputes unresolvable	Scheduled reconciliation, idempotent instructions,

Risk	Effect	Mitigation
		blocked transitions on unacknowledged instructions
Scope treated as fixed while decisions stay open	Change absorbed silently into the schedule	Change control from G1; every register item priced if it moves

12. What this document is

The build baseline for all eight modules, subject to the register in section 10 being closed at G1. Where the source is sound — the Foundation services in particular — this document carries its detail forward unchanged. Where the source contradicts itself, it picks one answer and states why. Where the source is silent on something the law requires, it adds it.
